Subject
Radiation Report on 54AC373DMQB

SMEX Common Buy Part No. 5962-8755501RA
Control Number: 1659

A radiation evaluation was performed on 54AC373 to determine the total dose tolerance of these parts. A brief summary of the test results is provided below. For detailed information, refer to Tables I through IV and Figure 1.

The total dose testing was performed using a cobalt-60 gamma ray source. During the radiation testing, eight parts were irradiated under bias (see Figure 1 for bias configuration), and two parts were used as control samples. The total dose radiation steps were 10, 20, 30, 50, 75 and 100 krads*. After 100 krads, the parts were allowed to anneal under bias at 25°C for 48 and 168 hours. The parts were further irradiated to 200 and 300 krads (cumulative), and then allowed to anneal under bias for 168 hours at 100°C. The dose rate was between 0.5 and 5.0 krads/hour depending on the total dose level (see Table II for the radiation schedule). After each radiation exposure and annealing treatment, the parts were electrically tested at 25°C according to the test conditions and the specification limits listed in Table III. These tests included two functional tests at 1MHz (at VCC levels of 2.0V and 5.5V) after each radiation and annealing step.

All eight parts passed all functional tests throughout the radiation testing and all parametric tests on irradiation to 10 krads. At 20 krads, all parts exceeded the maximum specification limit of 160uA for ICCH, ICCL and ICCZ (maximum readings were 1.8mA, 2.2mA and 1.4mA, respectively) and 10uA for IOZH (maximum reading was 30uA). At 30 krads, all parts failed to meet the minimum specification limit of -10uA for IOZL. ICC and IOZH/L readings continued to increase way beyond the specification limits on continued exposures to 50, 75 and 100 krads. No significant recovery was observed after annealing the parts for 168 hours at 25°C.

At 200 and 300 krads, all parts failed TPZL, as some outputs did not make the transition within the 1ms limit of the test equipment. After annealing the parts for 168 hours at 100°C, one

part (SN 214) recovered to pass TPZL and average ICC readings dropped significantly; however, average ICC readings (17mA) were still way above the specification limit of 160uA. Table IV provides the mean and standard deviation values for each parameter after each radiation exposure and annealing treatment. It also provides the functional test results after each radiation exposure and annealing treatment.

Any further details about this evaluation can be obtained upon request. If you have any questions, please call me at (301) 731-8954.

^{*}In this report, the term "rads" is used as an abbreviation for rads (Si).

Table I. Part Information

Generic Part Number:

54AC373

SMEX Common Buy

Part Number:

5962-8755501RA (HA124217)

SMEX Common Buy

Control Number:

1659

Charge Number:

C90359

Manufacturer:

National Semiconductor Corp.

Quantity Procured:

195

Lot Date Code:

9035A

Quantity Tested:

10

Serial Numbers of Radiation Samples:

212, 213, 214, 215 216, 217, 218, 219

Serial Numbers of Control Samples:

210, 211

Part Function:

Octal Transparent Latch

Part Technology:

CMOS

Package Style:

20-pin DIP

Test Engineer:

C. Nguyen

Post 300 krads Electrical Measurements	12/06/91
12) 168 hrs annealing at 100°C	12/06/91
Post 168 hr Electrical Measurements	12/26/91

Notes:

TOTAL PROPERTY.

⁻ All parts were radiated under bias at the cobalt-60 gamma ray facility at GSFC.

⁻ All electrical measurements were performed off-site at 25°C. - Annealing was performed under bias.

^{1/} The mean and standard deviation values were calculated over the eight parts irradiated in this testing. The control samples remained constant throughout the testing and are not included in this table.

^{2/} Due to calibration problems with the S-50, average AC timing measurements were overestimated at some radiation steps by as much as 2ns to 3ns. This upward shift is reflected in the values in Table IV, but is not indicative of AC failures in the parts. 3/ 48-hour annealing data is not provided here, but is available on request.

^{*} Parts did not make the transition within the lms testing range of the test equipment.

Figure 1. Radiation Bias Circuit for 54AC373

NOTE; ALL RESISTORS ARE IKA 14W 5% . $Vcc = 5V \pm 10\%$
